Javascript

.js ==> javascript file

variable

containers that stores some data

(numbers, strings(alphabets), booleans).....

Create a variable

3 ways

- 1) using var keyword
- 2) using let keyword
- 3) using const keyword

var keyword variables are not block scoped, they are global
scoped

let keyword variables are block scoped

{ } ==> block

In javascript we can create a function in 3 ways:-

- 1) function declaration
- 2) function expression
- 3) arrow function

Hoisting

Hoisting is a mechanism where javascript automatically
takes the function declaration and keeps it in the top of the
file

Array

If we want to perform certain operation on each and every element present in
the array, then we can use `forEach()`
